

Universal Extractor

Universal Extractor is a program designed to decompress and extract files from any type of archive or installer, such as ZIP or RAR files, self-extracting EXE files, application installers, etc. The full list of supported formats can be found in the table below. It's able to support so many varied file formats by utilizing the many backend utilities. Supported Formats As of v1.5, UniExtract uses TrID to determine the filetype of any given file. If this detection fails, file extensions are used as a backup identifier. The table below is a reference of known-supported filetypes and common extensions; any supported archive types should work regardless of actual extension.
